

# FOLLOW-UP PROGRAM

RP's Best Practice Recommendation (BPR) program improves patient outcomes by providing definitive, evidence-based, and standardized imaging follow-up recommendations. When armed with a clear imaging pathway, providers can anticipate and plan their patients' management and care efficiently.

Patient identification and retention have been identified as a key driver to improving patient outcomes. However, it is often difficult to identify potential patients requiring intervention and close management. RP's Follow-Up Program assists in bridging any gap between our radiologist's recommendation and the patient receiving follow-up care. Putting patient information in the right hands expedites patient care and patient education.

## FOLLOW-UP PROGRAM BENEFITS

Improvement in timely patient care

Reduce liability risk for missed follow-ups

Expanded role of radiologists in patient care

*RP's Follow-Up Program utilizes data science and machine learning to automate the identification of patients who need follow-up care. We work in collaboration with our healthcare clients to provide necessary patient-level details to coordinate the recommended care.*

*RP leverages the expertise of our physician National Subspecialty Division Leads and Advisory Boards to create and update our Best Practice Recommendation program. These fellowship-trained subspecialty radiologists synthesize recent published literature, develop evidence-based recommendations and train their peers on how to apply the Best Practice Recommendations.*
